What are the advantages of a  $\text{CaCO}_3 / \text{CaO}$  system?

Another key advantage of the  $\text{CaCO}_3 / \text{CaO}$  system is its high energy density, which allows maximizing the storage capacity. The theoretical energy density of the  $\text{CaCO}_3 / \text{CaO}$  system (around  $3\text{--}4\text{GJ/m}^3$ ) is one of the largest among the TCES systems considered in the literature [58,59].

Is calcium looping a suitable thermochemical energy storage system for solar power plants?

CC-BY 4.0 . Long-term storage capability is often claimed as one of the distinct advantages of the calcium looping process as a potential thermochemical energy storage system for integration into solar power plants. However, the influence of storage conditions on the looping performance has seldom been evaluated experimentally.

How does Calcium affect the performance of a heat storage system?

The lower the performance of  $\text{CaO}$ , the higher the inert solid content of the heat storage system for transportation, preheating, and cooling, resulting in a large amount of energy loss [ 67 ].

Is Calcium a good heat storage material?

The heat storage performance of the composite material (70% content of  $\text{CaO}$ ) was significantly better than that of limestone. After 20 cycles, the effective conversion of  $\text{CaO}$  was about 0.5. In addition, its heat storage density was about 40% higher than that of limestone after 50 cycles.

How effective is Calcium conversion after 20 cycles?

After 20 cycles, the effective conversion of  $\text{CaO}$  was about 0.5. In addition, its heat storage density was about 40% higher than that of limestone after 50 cycles. This was because the composite material had a porous structure, in which the evenly dispersed  $\text{SiO}_2$  alleviated the sintering and pore plugging of  $\text{CaO}$ .

Why do Calcium grains agglomerate during cyclic heat storage?

The Tammann temperature of calcium-based materials is relatively low, so  $\text{CaO}$  grains agglomerate and grow up during cyclic heat storage process at high temperature, leading to the blockage of the pore structure, which is manifested as a gradual decline in heat storage performance [43,123 ].
