Albania already finds it difficult to meet energy demand and maintain energy supply due to the fluctuations in the country's rainfall and other precipitation on which hydropower depends. As a result, hydropower production can vary between almost 6,000 GWh in very wet years to less than half that amount in very dry years.

Influence policy, build networks and raise your profile at the European level. The association brings together leading developers, utilities, research organisations and major industrial companies. They share the goal of accelerating the development and deployment of utility scale non-renewable and renewable energy projects.
