

What is crop selection & PV design for agrivoltaics?

Crop selection and PV design for agrivoltaics require synonymous optimization. The increasing global population amplifies the demand for food and energy. Meeting these demands should be a priority and aligned with the Sustainable Development Goals (SDGs). Photovoltaic (PV) systems are one of the key technologies for a sustainable energy transition.

What is agrivoltaics?

Therefore, new systems which enable dual land use are providing a solution to combine renewable energy and food production. Agrivoltaics (AV) aims to achieve an optimized dual land use for solar energy and crops.

Can photovoltaic systems be combined with agricultural production?

The concept of combining photovoltaic systems with agricultural production known as agrivoltaic systems (AVS) was initially proposed by Goetzberger & Zastrow back in 1982; however, it is rarely discussed until the beginning of the new millennium.

How much energy does a PV/wt/bat/Conv microgrid produce?

Energy dispatch for the PV/WT/BAT/CONV microgrid in (a) three successive days (21st, 22nd, and 23rd August) (b) an entire day (4th July). In this case, a 30-kW diesel generator is used to supply the entire electrical load with a total annual production of 87,600 kWh, respectively.

Are microgrids a viable solution for distributed energy resources?

Today, microgrids (MGs) offer a viable solution for integrating distributed energy resources, including in particular variable and unpredictable renewable energy sources (i.e., photovoltaic (PV), wind turbines (WTs), low-voltage and medium-voltage into distribution networks.
