

Can pp milk storage bottles be placed in a sterilizer for drying

How to sterilize milk bottles?

Usually the milk is sterilized at 108-111°C for 25-35 minutes. The sterilized milk bottles should be gradually cooled to room temperature. Any sudden cooling may lead to bottle breakage. Finally the milk-in-bottles should be stored in a cool place (De,2001). Sterilizers may be: (i) Batch; (ii) Continuous. (i) Batch Sterilizers

Are pp milk bottles durable?

They are durable, flexible and economical. Used to manufacture household items, PP milk bottles are available in clear and color-tinted transparency (like those of sports water bottles). Though PP bottles can withstand heat of up to 120°C, they may lose transparency over time with frequent sterilization and exposure to boiling water.

How do I sterilise my PPSU bottles?

Our PPSU bottles can be sterilised via the boiling, steam, ultra-violet ("UV") and sterilising tablet method. For sterilisation by boiling: Bring the water to a boil, turn off the gas/induction, submerge components in the boiled water for no more than 5 minutes.

How to sterilize plastic bottles?

Sterilizing plastic bottles can be easy with the right equipment. You can use a baby bottle sterilizer that also does the drying for you. This takes out the extra step of waiting for it to dry. When you're going through several bottles a day, especially as a new mom, you will be relieved that this sterilizer does the drying for you.

Can You steam sterilise bottles and feeding equipment?

You can steam sterilise bottles and feeding equipment using a microwave steriliser or an electric steam steriliser. Both types of steam sterilisers will sterilise the feeding equipment in a similar amount of time. When using the steam steriliser, make sure the openings of bottles, teats and feeding equipment are facing down into the steriliser.

What is the difference between sterilising and cleaning milk bottles?

Cleaning is when you remove any remaining dirt or remaining milk from the bottles and equipment using soap and water. Sterilising is when you remove all bacteria and germs from the bottles and equipment. You cannot sterilise without cleaning first as the dirt will still be on the bottles and equipment.
