Could distributed energy resources boost the deployment of renewables on islands?

Distributed energy resources - or small-scale energy resources that are usually situated near sites of electricity use, such as rooftop solar - could play an important role in boosting the deployment of renewables on islands, increasing the security, resilience and affordability of power systems while accelerating decarbonisation.

Do IEA islands need resilient power systems?

Islands need resilient power systems more than ever. Clean energy can deliver - Analysis - IEA Islands need resilient power systems more than ever.

Will the Virgin Islands reduce fossil fuel use by 60% by 2025?

The Virgin Islands, with support from the U.S. Department of Energy (DOE) and the Office of Energy Efficiency and Renewable Energy (EERE), have set a goal of reducing fossil fuel use by 60% by 2025.

Why do small islands need a new energy infrastructure?

Islands - including those that make up the group known as Small Island Developing States (SIDS) - also need to upgrade their energy infrastructure so that it is resilient to higher temperatures, more frequent natural disasters and flooding related to rising sea levels.

Why are some islands reliant on fossil fuels?

Like many islands around the globe, the featured islands are heavily reliant on fossil fuels for electricity generation, leaving them vulnerable to global oil price fluctuations that directly impact the cost of electricity.

What is Block Island's energy plan?

Block Island, Rhode Island is looking to identify renewable energy sources that can be used to generate electricity on the island and reduce reliance on imported electricity and fuels. The community will engage in energy planning to shore up its resilience, particularly in the face of sea-level rise.

Small and remote islands, which often have abundant renewable energy resources, have the potential to become hubs of clean energy innovation. While a study performed on 36 small island economies showed that the majority generated less than 10% of their electricity from renewable sources, encouraging trends are visible.

Our systems are designed to minimize sludge generation and will even digest organic sludge. While "facultative" systems only aerate the top few feet of water, our micro and nanobubble systems generate non-buoyant bubbles to ...
