

# Disadvantages of solar thermochemical energy storage

Why is thermochemical heat storage important?

Researchers examined thermochemical heat storage because of its benefits over sensible and latent heat storage systems, such as higher energy density and decreased heat loss. Solar energy is a promising alternative among the numerous renewable energy sources.

Can thermochemical thermal energy storage be used in solar-powered buildings?

This study examines different thermochemical thermal energy storage (TES) technologies, particularly adsorbent materials used for seasonal heat storage in solar-powered building systems. This evaluation is confined to thermochemical energy storage devices with charging temperatures less than 140 °C.

Why is thermal energy storage important?

In this perspective, thermal energy storage (TES) is essential in developing sustainable energy systems. Researchers examined thermochemical heat storage because of its benefits over sensible and latent heat storage systems, such as higher energy density and decreased heat loss.

Are thermochemical systems better than sensible and latent heat storage technologies?

Thermochemical systems coupled to power-to-heat are receiving an increasing attention due to their better performance in comparison with sensible and latent heat storage technologies, in particular, in terms of storage time dynamics and energy density.

What are thermochemical energy storage systems?

While the focus is on low-temperature applications such as residential heating, thermochemical energy storage systems are also being considered for industrial waste heat applications or for solar thermal power plants, with TCES seen as a promising option for high-temperature systems [Pardo2014].

How is solar thermal energy stored?

In these systems, the solar thermal energy is stored by endothermic reaction and subsequently released when the energy is needed by exothermic reversible reaction. This review compares and summarizes different thermochemical storage systems that are currently being investigated, especially TCS based on metal oxides.
