Does liquid air energy storage improve data-center immersion cooling?

A mathematical model of data-center immersion cooling using liquid air energy storage is developed to investigate its thermodynamic and economic performance. Furthermore, the genetic algorithm is utilized to maximize the cost effectiveness of a liquid air-based cooling system taking the time-varying cooling demand into account.

Can a data center cooling system use liquid air energy storage?

By using liquid air energy storage, the system eliminates the date center's reliance on the continuous power supply. Develop a thermodynamic and economic model for the liquid-air-based data center cooling system, and carry out a sensitivity analysis on operating parameters for the cooling system.

Can a liquid immersion coolant be used to cool Lib cells?

Jithin et al. numerically analyzed liquid immersion cooling for LIBs using different coolants, including deionized water, mineral oil, and an engineered fluid. The results revealed that improving the specific heat and thermal conductivity of the coolant can be beneficial for cooling LIB cells under high-discharge conditions.

Is liquid air a viable cooling technology for high-density data centers?

The evaporation process of liquid air leads to a high heat absorption capacity, which is expected to be a viable cooling technology for high-density data center. Therefore, this paper proposes a liquid air-based cooling system for immersion cooling in data centers.

Why is air cooling a problem in energy storage systems?

Conferences > 2022 4th International Confer... With the energy density increase of energy storage systems (ESSs),air cooling,as a traditional cooling method, limps along due to low efficiency in heat dissipation and inability in maintaining cell temperature consistency. Liquid cooling is coming downstage.

How is immersion coolant stored in a cold storage tank?

A fixed amount f immersion coolant is stored in the cold storage tank, and its thermophysical properties are provided in Table 3. The cold energy released by the evaporator, economizer, and chiller is harnessed to lower the temperature of the cold storage tank, effectively storing the cold energy within it.
