Should wind turbine blades be segmented?

Conclusions As wind turbine blades grow ever larger, segmentation has the potential to increase blade access to certain regions and reduce blade transportation costs. A detailed mechanical joint model was developed and integrated into the open-source WISDEM framework, supporting the future research and design of segmented blades.

Can a segmented rotor blade be used for a 50 MW wind turbine?

A detailed Level I design and analysis of a segmented rotor blade for an extreme-scale 50 MW wind turbine is presented herein. Detailed methodologies were developed to investigate the impact of segmentation on the blade mass and blade frequencies while evaluating its structural feasibility.

What is a rotor blade in a wind turbine?

The rotor blade is the key component of a wind turbine generator (WTG) and converts the energy of the wind into a mechanically useful form of energy. It represents a significant cost factor in the overall context of the turbine and at the same time has an enormous impact on the yield of the turbine.

How big are wind turbine blades?

As wind turbines continue to grow ever larger to reduce the cost of energy, their blades follow suit, with the largest commercial onshore blades extending past 100 m. Massive blades such as these raise key transportation and manufacturing challenges, especially for land-based turbines.

How to simulate a rotor blade in a wind turbine?

The usual procedure is to carry out a load simulation with an initial model draft of a rotor blade. In relation to the wind turbine, the rotor blade is described by its stiffness distribution, its mass and its static moment.

Can a joint design model optimize a wind turbine with segmented blades?

A case study is presented that highlights the ability of the joint design model coupled with WISDEM to optimize a wind turbine with segmented blades. The case study focuses on the following question: What joint location is optimal, in terms of blade mass and cost?

We investigate the feasibility of segmenting a 250 m blade by developing design methods and analyzing the impact of segmentation on the blade mass and blade frequencies. This investigation considers various ...
