

# Generator inlet and outlet air temperatures are high

What does a larger  $\eta$  mean in a generator?

In addition, a larger  $\eta$  also indicates a lower exhaust outlet temperature and a lower average temperature at the hot end of the TEM, and the thermoelectric efficiency will decrease. Fig. 6. Temperature distribution inside the generator along the direction of hot fluid flow.

How does a generator cooling system work?

The cooling system requires airflow supplied by a fan, which is either mechanically driven from the front of the generator's ICE or is electrically driven. Cooling systems are designed to provide adequate cooling for full load operation at a specified ambient air temperature typically between 40°C; (104°F;) and 50°C; (122°F;).

Why does HTF release more heat in a generator?

As can be seen from the figure, with the increase of  $\eta$ , HTF releases more heat in the generator. In order to realize energy equilibrium, the temperature of HTF entering into the exhaust-HTF heat exchanger decreases to increase the temperature difference between the exhaust and HTF, so that HTF absorbs more heat from the exhaust.

How does a generator work?

based on lower average temperatures than current and projected levels. 1.2 COOLING - Generator systems, above 15kW usually incorporate water-cooled prime movers, gasoline, gaseous or diesel. Water used to take away engine heat is cooled by fans pushing air through a radiator, remote or engine mounted. The higher the ambient temperature

Why is it that before turbocharger temperatures are higher than exhaust outlets?

He asked the 2nd why is it that before turbocharger temperatures are higher than exhaust outlets, to which the apparent right answer was to do with kinetic energy from the exhaust gas becoming heat energy before the turbine inlet.

What are the requirements for a gas turbine inlet temperature regulator?

The gas turbine inlet temperature regulator has strict requirements for the resistance of the air flow outside the tube. Generally, the operating resistance is required to be controlled below 150 Pa, which requires that the air flow speed should not be too high.
