What are the different types of molten salt energy storage systems?

There are two different configurations for the molten salt energy storage system: two-tank direct and thermocline. The two-tank direct system, using molten salt as both the heat transfer fluid (absorbing heat from the reactor or heat exchanger) and the heat storage fluid, consists of a hot and cold storage tank.

How does a molten salt thermal energy storage system work?

Molten-salt thermal energy storage (TES) systems utilize high-temperature molten salts to store and release thermal energy. In the charging state, the system reduces the output power of the unit by extracting high-temperature, high-pressure gas from the turbine and exchanging heat with the molten salt.

How molten salt is used in hot and cold storage tanks?

The same molten salt is used in both the hot and cold storage tanks. The molten salt receives heat from the secondary heat exchanger, travels to the hot storage tank, and is transported to the power cycle heat exchanger through a pump. From the heat exchanger, the molten salt travels to the cold storage tank.

How does molten salt travel through a heat exchanger?

The molten salt receives heat from the secondary heat exchanger, travels to the hot storage tank, and is transported to the power cycle heat exchanger through a pump. From the heat exchanger, the molten salt travels to the cold storage tank. The mass flow rate at the exit point of the hot storage tank depends on the required power to the grid.

Can molten salts be used as heat storage medium?

The low vapor pressure results in storage designs without pressurized tanks (Fig. 1). Molten salts are suitable both as heat storage medium and heat transfer fluid (HTF). In general, there is experience with molten salts in a number of industrial applications related to heat treatment, electrochemical treatment and heat transfer for decades.

What is molten salt storage in concentrating solar power plants?

At the end of 2019 the worldwide power generation capacity from molten salt storage in concentrating solar power (CSP) plants was 21 GWh el. This article gives an overview of molten salt storage in CSP and new potential fields for decarbonization such as industrial processes, conventional power plants and electrical energy storage.
