Can a thermocouple measure turbine inlet temperature?

However, it is impractical to measure turbine inlet temperature in most engines, especially large engines. Consequently, temperature thermocouples are inserted at the turbine discharge, where the temperature provides a relative indication of that at the inlet.

What does  $\Delta T$  mean in a steam generator?

$\Delta T$  where:  $\Delta T$  is the difference in temperature across the steam generator (in this case, the difference between the average temperature of the reactor coolant -  $T_{avg}$  and the saturation temperature determined by system pressure.

What temperature does a steam generator run at?

When steam generators are operated at approximately 6.0 MPa, it means the saturation temperature is equal to 275.6 °C. Since there must always be  $\Delta T$  (~15 °C) between the primary circuit and the secondary circuit, the reactor coolant (in the cold leg) has about 290.6 °C (at HFP) at the inlet of the core.

Does changing turbine inlet temperature increase net power?

For this purpose, based on the energy, exergy, environmental, and economic (4E) analyses, the effects of changing turbine inlet temperature (TIT) on a gas turbine power plant in northeastern Iran were studied. The results showed that increasing TIT enhanced net power and efficiency, so that increasing TIT about 10 K enhanced net power by 1.7%.

How does a gas generator control system work?

The control system is set to follow the inlet air temperature function. By contrast, the control system on aeroderivatives uses unbiased gas generator discharge temperature to approximate firing temperature. The gas generator can operate at different speeds from the power turbine, and the power will actually increase as fuel is added to raise the

Can in situ turbine rotor inlet temperature be measured in an 8200 kW engine?

This paper provides in situ turbine rotor inlet temperature measurements in an 8200 kW operating gas turbine engine. The measurements were obtained using integrated spectral infrared emission from the water vapor of the combustion gases entering the turbine rotor.
