What is solar photovoltaic (PV) power generation?

Solar photovoltaic (PV) power generation is the process of converting energy from the sun into electricity using solar panels. Solar panels, also called PV panels, are combined into arrays in a PV system. PV systems can also be installed in grid-connected or off-grid (stand-alone) configurations.

How does a solar PV system work?

Solar PV panels - convert sunlight into electricity. Inverter - this might be fitted in the loft and converts the electricity from the panels into the form of electricity which is used in the home. Generation meter - records the amount of electricity generated by the solar PV system.

How is solar power generated?

Solar power is generated in two main ways: Solar photovoltaic (PV) uses electronic devices, also called solar cells, to convert sunlight directly into electricity. It is one of the fastest-growing renewable energy technologies and is playing an increasingly important role in the global energy transformation.

Can a solar PV system store electricity?

Solar PV systems cannot store the electricity they produce unless you also have a battery fitted to your home (which most don't). In order to use the electricity produced for free, you must use it at the time it is generated - it can't be saved for later in the evening.

How does photovoltaic (PV) technology work?

Photovoltaic (PV) materials and devices convert sunlight into electrical energy. What is photovoltaic (PV) technology and how does it work? PV materials and devices convert sunlight into electrical energy. A single PV device is known as a cell. An individual PV cell is usually small, typically producing about 1 or 2 watts of power.

What are grid-connected and off-grid PV systems?
