

What is a load shedding solution?

The load-shedding solution ensures a swift disconnection of low-priority loads after detection of a power network disturbance. It is designed to utilize the full potential of the IEC 61850 standard for communication and interoperability of substation automation devices.

What is intelligent load shedding?

Intelligent Load Shedding means the monitoring and making decisions based on the state of the system model, value of the operation, criticality of the processes running, and environmental impact. ETAP iLS predicts the optimal load shedding scenario based on actual system dynamics, making it the most intelligent solution available, hands down.

What is load shedding & demand curtailment?

Load Shedding and demand curtailment are critical for the preservation of essential loads and avoiding widespread system outages. This power balancing strategy should be based on an integrated fast-responding system that considers process and power system dynamics.

What is a model-driven load shedding solution?

A model-driven load shedding solution incorporates power system topology with Dynamic Load Priority tablesto automatically analyze and track the system changes with a fast-acting response to disturbance triggers.

What is a proactive intelligent load shedding system?

A Proactive Intelligent Load Shedding system provides faster, and proven optimal load reliefby utilizing an electrical digital twin foundation with embedded power and process predictive analytics, adaptive optimization algorithms, and Action Validation to secure service continuity to critical processes and subsystems.

What is ETAP intelligent load shedding?

With multiple redundant units available, ETAP ILS is the safest and reliable method for load shedding. The power and functionality of ETAP Intelligent Load Shedding system really hit the mark with the challenges Holcim had at the plant. The risk from unscheduled power outages has all but almost disappeared.

A Proactive Intelligent Load Shedding system provides faster, and proven optimal load relief by utilizing an electrical digital twin foundation with embedded power and process predictive analytics, adaptive optimization algorithms, and Action Validation to secure service continuity to critical processes and subsystems.
