What is a microgrid system?

A microgrid system is a low/medium voltage power networkthat hosts distributed and renewable energy sources, storage devices, and loads, with a view to best utilise renewable energy resources and reduce dependency on fossil fuel-based energy sources to ensure reduction in greenhouse gas (GHG) emission.

How to design a microgrid?

Appropriate sizing of microgrid components, that is, number and size of PV modules, batteries, DGs and associated power electronic devices determines the efficient and economic design of the microgrid. There are numerous sizing approaches available in the literature, which are subjective to the requirements of the microgrid operator.

What is the design and optimal sizing of a microgrid?

The design and optimal sizing of a microgrid consist of determining the nominal capacity of generation systems, configuration, storage capacity, and the operational strategy to maximize reliability and minimize operational cost and pollutant emissions in the life cycle of the project, among other design objectives.

How to calculate wind energy potential in a microgrid?

Collecting meteorological data at the system possible locations is the first step of the microgrid design. Most commonly used approaches to quantify the energy potential are based on meteorological data and statistical analysis. Weibull probability function distribution a widely used approach for wind energy potential assessment.

How is Tel calculated in a microgrid sizing with storage system?

Additionally, it is possible to use this criterion in a microgrid sizing with storage system, where TEL is only considered when the storage system charge is full and the excess of energy generation is lost. It is calculated as follows, where PG is the power available by the generation and storage system and PL is the power demand.

How are microgrids energy sources sized?

Sizing of microgrids energy sources does not require a deep study of the interactions between its subsystems; moreover, this stage of the design relies on data such as wind speed or sunlight profiles measured with a resolution of minutes or even hours [17, 29].
