How to improve the performance of large-area flexible organic photovoltaic modules?

Here we improve the performance of large-area flexible organic photovoltaic modules through suppressing electrical shunt and improving electrical contact. We embed large-area silver nanowire electrodes into polymer substrates to reduce surface roughness and therefore to suppress electrical shunt.

Do large-area flexible organic photovoltaic modules suffer from electrical shunt?

Large-area flexible organic photovoltaic modules suffer from electrical shunt and poor electrical contact between adjacent subcells, causing efficiency and stability losses. Here we improve the performance of large-area flexible organic photovoltaic modules through suppressing electrical shunt and improving electrical contact.

Why are organic photovoltaic (OPV) cells important?

Organic photovoltaic (OPV) cells have attracted broad research attention, because organic semiconductors offer advantages, including mechanical flexibility, light weight, and facile module manufacture by high-throughput printing methodologies, vis-a-vis conventional inorganic solar materials.

Does nanoparticle incorporation lead to photovoltaic hybrid materials?

Even though some preliminary reports are available regarding the nanoparticle incorporation into such semiconductor block copolymers leading to photovoltaic hybrid materials, the reported power conversion efficiency values were still low compared to simple blends of conjugated polymers and semiconductor nanoparticles.

Are solution-processed organic photovoltaics scalable and cost-effective?

Overall, this work represents a step towards the scalable, cost-effective manufacturing of organic photovoltaics with both high performance and high throughput. Solution-processed organic photovoltaics (OPVs) represent one of the most promising photovoltaic technologies for clean and renewable energy sources 1,2,3,4.

What is hybrid photovoltaics?

In hybrid photovoltaics, an organic and an inorganic semiconductor are combined in the active layer, with the advantages of both material classes in a single device. The organic component contributes towards the possibility for wet chemical device preparation with potentially low costs in combination with achieving flexible devices.
