Does a crack in a photovoltaic module affect power generation?

This paper demonstrates a statistical analysis approach, which uses T-test and F-test for identifying whether the crack has significant impact on the total amount of power generated by the photovoltaic (PV) modules. Electroluminescence (EL) measurements were performed for scanning possible faults in the examined PV modules.

Do PV modules have cracks?

Before examining the cracks in the PV modules, a real time long-term data measurements are taken to compare the output power performance of the PV modules versus the theoretical predictions simulated using LabVIEW software. This test was made to investigate the degradation level of the power in each PV module separately.

What causes cell cracks in photovoltaic panels?

Cell cracks appear in the photovoltaic (PV) panels during their transportation from the factory to the place of installation. Moreover, some climate proceedings such as snow loads, strong winds and hailstorms might create some major cracks on the PV modules surface [ - ].

Can cracks degrade PV output power under controlled indoor testing?

Usually, and as explained in multiple previous studies [21,22,23], cracks can degrade the PV output power under controlled indoor testing; these various studies, however, do not consider the influence of the size of the cracks and the correlation between the cracks and their thermal impact on the PV modules.

How do micro cracks affect PV module 7?

PV module 7 contains only eight solar cells out of 60 which are affected by micro cracks. These micro cracks reduce the amount of power generated by the PV module up to 19.27%. This reduction of the PV output power could be enhanced by replacing the cracked PV solar cells or adding a bypass diode in parallel with the solar cells PV string.

Does PV crack affect output power performance?

A statistical analysis approach is used to determine whether the PV crack has a significant impact on the total generated output power performance or not. Two statistical methods are used, T-test and F-test. The first method (T-test) is used to compare the simulated theoretical power with the measured PV output power.
