

Despite its growth from 73.3 GWh in 2015 to 81GWh in 2019, Lithuania has ranked the lowest in solar electricity generation among EU producers in recent years. Amongst the available renewable sources, solar power is the least generated.

The report dissects the Lithuania solar power Market into segments by end-use sector and by technology type (solar photovoltaic (PV) and Concentrated solar power). A detailed summary of the current scenario, recent developments, and market outlook will be provided for each segment.

to the European Commission, Lithuania has increased its goal to increase solar capacity by 500% in 2030, reaching 5.1 GW. This is a significant rise compared to the current NECPs, making Lithuania the country with the largest increase in solar targets relative to the existing NECPs.

As of 2012, Lithuania has 1,580 small (from several kilowatts to 2,500 kW) solar power plants with a total installed capacity of 59.4 MW which produce electricity for the country, and has an uncounted number of private power plants which make electricity only for their owners.
