What causes a generator rotor to degrade?

One component of the generator that is typically refurbished, upgraded or uprated is the generator rotor (field). Degradation of the generator field can be caused by a number of factors, including a breakdown in insulation due to time and temperature and mechanical wear.

What factors affect a generator rotor?

There are a number of other concerns that also affect generator rotors. Thermal sensitivity is the term used to describe an excessive vibration of the generator rotor, induced by the heating effect of the field current. As field current flows in the winding, the copper heats up. Two things happen as a consequence:

How does a generator rotor and stator work?

The generator rotor and stator incorporated inlet and outlet sections along their axial lengths to achieve uniform cooling along the length of the generator field. This uniform cooling eliminated axial hotspots and allowed the ratings of the generators to be increased.

Can a generator rotor be changed?

Many options are available to the user in which the rotor can be restored to the original condition, modified to present day design condition or replaced with a new, upgraded design. Modifying or replacing the generator rotors also gives the user the possibility of uprating the generator. Q. What is the typical lifespan of a generator rotor?

What are the components of a generator rotor?

The size and life of generator rotors are temperature, mechanical force and electrical insulation. typical generator field. Note the major components: rework or modifications is also discussed. This There are, of course, variations on this configuration. For example, while the illustrated design uses radial fans, other designs use axial fans.

What causes a generator rotor insulation breakdown?

What are the most common causes of a generator rotor insulation breakdown? A. The degradation in insulation is caused by and/or operating incidents. A breakdown in the insulation will cause shorted turns between conductors or a the field forging or retaining ring.
