Are DC transmission technologies a good option for future power grids?

This article reviews dc transmission technologies for future power grids. The article emphasises the attributes that each technology offers in terms of enhance controllability and stability, resiliency to ac and dc faults, and encourages increased exploitations of renewable energy resources (RERs) for electricity generation.

Which utilities have partnered with weavegrid?

Major utility companies like PG&E,DTE,and Xcel Energyhave partnered on the program. DTE Energy,a Detroit-based utility company that serves southern Michigan,has worked with WeaveGrid to help improve grid planning.

How can data driven smart grids avoid poor utilisation?

To avoid poor utilisation of the generation and transmission infrastructures in data drove smart grids, fast and secure communication systems capable of dealing with large data and a number of high-level controllers will be required to optimise the power flow at the transmission level. This flow optimisation can be done with:

What is gridshare & how does it work?

Services like Gridshare are mainly designed to help individual customers save money and energy. But in the aggregate,it also provides utility companies with clearer behavioral patterns that help them improve energy planning. Capturing such nuances is vital for grid responsiveness.

How is ai changing the power grid?

Here are four of the ways that AI is already changing how grid operators do their work. 1. Faster and better decision-makingThe power grid system is often described as the most complex machine ever built.

How does Lunar Energy's gridshare work?

Lunar Energy's Gridshare software gathers datafrom tens of thousands of homes,collecting information on energy used to charge electric vehicles,run dishwashers and air conditioners,and more. Combined with weather data,this information feeds a model that creates personalized predictions of individual homes' energy needs.
